(54) Title: CHEMICAL COMPOUNDS			
(57) Abstract The invention relates to masked monophosphate nucleoside analogues, their preparation and their therapeutic use in the treatment of viral infection, including infection by HIV. In particular, the invention relates to aryl phosphoramidate 2',3'-dideoxy and 2',3'-dideoxydidehydro of nucleoside analogues and of PMEA.

CHEMICAL COMPOUNDS

The present invention relates to a new class of nucleoside analogues and their therapeutic use in the prophylaxis and treatment of viral infection, for example by human immunodeficiency virus (HIV), which is believed to be the aetiological agent in human acquired immunodeficiency syndrome (AIDS).

There has been much interest in the use of nucleoside analogues as inhibitors of HIV. 2',3'-dideoxy-2',3'-dideoxythymidine (d4T) and 3'-azido-3'-deoxythymidine (AZT) are both known inhibitors of HIV [Hitchcock et al., Antiviral Chem. Chemother. (1991), 2, 125; Mansuri et al., Antimicrob. Agents Chemother., (1990), 34, 637.]. The inhibition of HIV by these, and other nucleoside analogues, is conventionally thought to depend upon conversion of the nucleoside analogue *in vivo* to the corresponding 5'-triphosphate by (host-cell) kinase enzymes. However, this absolute dependence upon (host-cell) kinase-mediated activation can lead to poor activity, the emergence of resistance, and clinical toxicity.

In order to reduce the dependence on kinase enzymes the use of masked phosphate pro-drugs of the bioactive nucleotide forms of several chemotherapeutic nucleoside analogues has been suggested [McGuigan et al., Nucleic Acids Res., (1989), 17, 6065; McGuigan et al., Ibid., (1989), 17, 7195; Chawla et al., J. Med. Chem., (1984), 27, 1733; Sergheraert et al., J. Med. Chem. (1993), 36, 826-830.]. In particular, McGuigan *et al* [J. Med. Chem. 36, 1048-1052 (1993)] have reported the preparation of aryl ester - phosphoramidate derivatives of AZT. *In vitro* evaluation of these compounds revealed the compounds to have anti-HIV activity. However, in "normal" thymidine kinase rich (TK⁺) cells, the activity of such compounds was at least an order of magnitude less than the parent nucleoside AZT. Only in TK-deficient (TK⁻) cells, in which the activity of the aryl ester -

phosphoramidate derivatives was virtually maintained but the activity of AZT was reduced, did the activity of the derivatives exceed that of AZT.

5 McGuigan et al [Bioorganic & Medical Chemistry Letters, 3, (6), 1203-1206 (1993)] have also reported preparation of triester phosphate derivatives of d4T. Again, in vitro evaluation of these compounds revealed that whilst the compounds have significant anti-HIV activity, the activity
10 is less than that of the parent nucleoside d4T in TK⁺ cells.

Abraham and Wagner (Nucleosides and Nucleotides 13(9). 1891-1903 (1994)) have reported the preparation of nucleoside phosphoramidate diesters and triesters but do not report any
15 biological activity.

The acyclic nucleoside analogue 9(2-phosphonomethoxyethyl) adenine (PMEA), and analogues thereof, have been demonstrated to show activity against herpes viruses and
20 retroviruses including HIV (Calio et al., Antiviral Res., (1994), 23(1), 77-89; Balzarini et al., AIDS, (1991), 5(1), 21-28).

To date, the approach of providing masked phosphate pro-
25 drugs has failed to enhance the anti-viral activities of the parent nucleoside analogues such as AZT and d4T in TK⁺ cells. Furthermore, the emergence of resistance to the nucleoside analogues in their bioactive 5'-triphosphate form has rendered the reported masked phosphate pro-drugs and
30 their parent nucleoside analogues potentially ineffective.

It has now been found that a particular class of masked nucleoside analogues are highly potent viral inhibitors in both TK⁻ and TK⁺ cells, and yet retain activity against
35 nucleoside (e.g. d4T) - resistant virus.

According to the present invention there is provided a compound of the formula (1)

5

10 wherein Ar is an aryl group;

Y is oxygen or sulphur;

15

X¹ is selected from O, NR³, S, CR³R⁴, CR³W¹ and CW¹W² where R³ and R⁴ are independently selected from hydrogen, alkyl and aryl groups; and W¹ and W² are heteroatoms;

20

X²-X⁶ may be absent; or X⁶ is CH₂ and X² is selected (independently of X¹) from O, NR³, S, CR³R⁴, CR³W¹ and CW¹W² where R³ and R⁴ are independently selected from hydrogen, alkyl and aryl groups; and W¹ and W² are heteroatoms;

25

X³ is a C₁₋₆ alkyl group;

X⁴ is oxygen or CH₂;

30

X⁵ may be absent or is CH₂;

Z is selected from O, NR⁵, S, alkyl and aryl groups, where R⁵ is selected from hydrogen, alkyl and aryl groups;

35

J is selected from hydrogen, alkyl, aryl, heterocyclic and polycyclic groups;

Q is selected from O, NR⁶, S, CR⁶R⁷, CR⁶W³ and

CW^3W^4 , where R^6 and R^7 are independently selected from hydrogen, alkyl and aryl groups; and W^3 and W^4 are heteroatoms;

5 T^1 and T^2 are independently selected from hydrogen and CH_2R^8 , where R^8 is selected from H, OH and F; or T^1 and T^2 are linked together and together are selected from the groups

10

15

where R^9 is selected from H, halogen, CN, NH_2 , CO-alkyl and alkyl; and R^{10} , R^{11} , R^{12} are independently selected from H, N, halogen, CN, NH_2 , CO-alkyl and alkyl;

20

B is a purine or pyrimidine base;

or a pharmaceutically acceptable derivative or metabolite thereof.

25

The compounds of the present invention are potent anti-viral agents. In particular, they are highly active against HIV in both TK and TK⁺ cells. Particularly surprising is the activity of the compounds of the present invention against
30 nucleoside-resistant HIV. These observations indicate that the activity of these compounds is not wholly dependent upon the conventional mode of action (requiring hydrolysis of the phosphate aryl ester and P-X¹ bonds followed by kinase-dependent conversion to the 5'-triphosphate derivative), but
35 arises from an entirely different mode of action. The experimental data presented herein indicates that the compounds and metabolites of the present invention are directly acting as reverse transcriptase (RT) inhibitors via

a previously unrecognised metabolic pathway and mechanism of action.

Reference in the present specification to an alkyl group means a branched or unbranched, cyclic or acyclic, saturated or unsaturated (e.g. alkenyl or alkynyl) hydrocarbyl radical. Where cyclic, the alkyl group is preferably C₃ to C₁₂, more preferably C₃ to C₁₀, more preferably C₃ to C₇. Where acyclic, the alkyl group is preferably C₁ to C₁₆, more preferably C₁ to C₆, more preferably methyl. Reference in the present specification to alkoxy and aryloxy groups means alkyl-O- and aryl-O- groups, respectively. Reference to alkoyl and aryloyl groups means alkyl-CO- and aryl-CO-, respectively.

Reference in the present specification to an aryl group means an aromatic group, such as phenyl or naphthyl, or a heteroaromatic group containing one or more, preferably one, heteroatom, such as pyridyl, pyrrolyl, furanyl and thiophenyl. Preferably, the aryl group comprises phenyl or substituted phenyl.

The alkyl and aryl groups may be substituted or unsubstituted, preferably unsubstituted. Where substituted, there will generally be 1 to 3 substituents present, preferably 1 substituent. Substituents may include halogen atoms and halomethyl groups such as CF₃ and CCl₃; oxygen containing groups such as oxo, hydroxy, carboxy, carboxyalkyl, alkoxy, alkoyl, alkoyloxy, aryloxy, aryloyl and aryloyloxy; nitrogen containing groups such as amino, alkylamino, dialkylamino, cyano, azide and nitro; sulphur containing groups such as thiol, alkylthiol, sulphonyl and sulfoxide; heterocyclic groups which may themselves be substituted; alkyl groups, which may themselves be substituted; and aryl groups, which may themselves be substituted, such as phenyl and substituted phenyl. Alkyl includes substituted and unsubstituted benzyl.

Reference in the present specification to heterocyclic groups means groups containing one or more, pyrrolyl, imidazolyl, pyrazolyl, thiazolyl, isothiazolyl, oxazolyl, pyrrolidinyl, pyrrolinyl, imidazolidinyl, imidazolinyl, 5 pyrazolidinyl, tetrahydrofuranyl, pyranyl, pyronyl, pyridyl, pyrazinyl, pyridazinyl, piperidyl, piperazinyl, morpholinyl, thionaphthyl, benzofuranyl, isobenzofuryl, indolyl, oxyindolyl, isoindolyl, indazolyl, indolinyl, 7-azaindolyl, isoindazolyl, benzopyranyl, coumarinyl, isocoumarinyl, 10 quinolyl, isoquinolyl, naphthridinyl, cinnolinyl, quinazolinyl, pyridopyridyl, benzoxazinyl, quinoxadinyl, chromenyl, chromanyl, isochromanyl and carbolinyl.

References in the present specification to polycyclic groups 15 means a group comprising two or more non-aromatic carbocyclic or heterocyclic rings which may themselves be substituted.

Reference in the present specification to halogen means a fluorine, chlorine, bromine or iodine radical, preferably 20 fluorine or chlorine radical.

The group Ar comprises a substituted or unsubstituted aryl group, wherein the term "aryl group" and the possible substitution of said group is as defined above. Preferably, 25 Ar is a substituted or unsubstituted phenyl group. Particularly preferred substituents are electron withdrawing groups such as halogen (preferably chlorine or fluorine), trihalomethyl (preferably trifluoromethyl), cyano and nitro groups. Preferably, Ar is phenyl, 3,5-dichloro-phenyl, p- 30 trifluoromethyl-phenyl, p-cyano-phenyl, or p-nitro-phenyl.

Y may be oxygen or sulphur. Preferably, Y is oxygen.

X¹ is from O, NR³, S, CR³R⁴, CR³W¹ and CW¹W² where R³ and R⁴ are 35 independently selected from hydrogen, alkyl and aryl groups; and W¹ and W² are heteroatoms. Preferably, X¹ is selected from O, S and NR³. Preferably, X¹ is NR³. When present, R³ is preferably H. When present, W¹ and W² may independently comprise any heteroatom such as a halogen, preferably

fluorine.

- X²-X⁶ may be absent; or X⁶ is CH₂ and X² is selected (independently of X¹) from O, NR³, S, CR³R⁴, CR³W¹ and CW¹W² where R³ and R⁴ are independently selected from H, alkyl and aryl groups; and W¹ and W² are heteroatoms. When present, X² is preferably oxygen. When present, R³ is preferably H. When present W¹ and W² may independently comprise any heteroatom such as halogen, preferably fluorine.
- 10 X⁴ is oxygen or CH₂. Preferably, X⁴ is oxygen.
- X⁵ may be absent or is CH₂.
- 15 Z may comprise O, NR⁵, S, alkyl or aryl groups, where R⁵ is selected from H, alkyl and aryl groups. Preferably, Z is O or NR⁵. Preferably, R⁵ is hydrogen. Most preferably, Z is oxygen.
- 20 J is selected from hydrogen, alkyl, aryl, heterocyclic and polycyclic groups. Preferably, J is a substituted or unsubstituted alkyl group. Preferably, J is a substituted or unsubstituted C₁₋₆ alkyl group, preferably a benzyl or methyl group.
- 25 X³ is a C₁₋₆ alkyl group. X³ may be a C₁₋₆ substituted or unsubstituted, branched or unbranched, methylene chain. Preferably, X³ is a group CR¹R² where R¹ and R² are independently selected from hydrogen, alkyl and aryl groups.
- 30 Preferably, at least one of R¹ and R² is hydrogen. It will be appreciated that if R¹ and R² are different, the carbon atom to which they are bonded is an asymmetric centre. The stereochemistry at this site may be R or S or mixed. When one of R³ and R⁴ is hydrogen, the stereochemistry is
- 35 preferably S.
- Q is selected from O, NR⁶, S, CR⁶R⁷, CR⁶W³ and CW³W⁴, where R⁶ and R⁷ are independently selected from hydrogen, alkyl and aryl groups; and W³ and W⁴ are heteroatoms such as halogen

atoms, preferably fluorine. Preferably, Q is O, S, CH₂ or CF₂. Most preferably, Q is oxygen.

T¹ and T² are independently selected from hydrogen and CH₂R⁸ where R⁸ is selected from H, OH and F; or T¹ and T² are linked together and together are selected from the groups:-

15

where R⁹ is selected from H, halogen, CN, NH₂, CO-alkyl, and alkyl, preferably R⁹ is H or F; and R¹⁰, R¹¹, and R¹² are independently selected from H, N₃, halogen, CN, NH₂, CO-alkyl, and alkyl, preferably R¹⁰, R¹¹ and R¹² are independently selected from H, F and N₃. It will be appreciated that R⁹ corresponds to the 3' - α position and R¹⁰ corresponds to the 3' - β position. Preferably, T¹ and T² are linked together and together form the group:-

25

30 B comprises a purine or pyrimidine base, such as adenine thymine, uracil, cytosine or guanine and derivatives thereof. Derivatives thereof include substituted purine or pyrimidine bases wherein the substituents are as defined above. Examples of substituted bases include 5-substituted
35 pyrimidine. Preferably, B is adenine or thymine.

Preferably, the present invention provides a compound of formula (2)

wherein Ar, R¹, J, X², X⁵, X⁶, Q, T¹, T² and B are as defined above; or a pharmaceutically acceptable derivative or metabolite thereof.

It will be appreciated that the group -NH-CHR¹-CO₂J corresponds to a carboxy-protected α-amino acid. Preferably, the group R¹ corresponds to the side chain of a naturally occurring amino acid such as Alanine, Arginine, Asparagine, Aspartic Acid, Cysteine, Cystine, Glycine, Glutamic Acid, Glutamine, Histidine, Isoleucine, Leucine, Lysine, Methionine, Phenylalanine, Proline, Serine, Threonine, Tryptophan, Tyrosine, Valine. Preferably, R¹ is Me or PhCH₂ corresponding to the side chain of alanine or phenylalanine, respectively. Preferably, the stereochemistry at the asymmetric centre -CHR¹- corresponds to an L-amino acid.

According to one preferred embodiment, the present invention provides a compound of formula (3):-

wherein Ar, Y, X¹, X², X³, X⁴, Z, Q and B are as defined
5 above.

More preferably, the invention provides a compound,
according to formula (3), of formula (4):-

10

15

20

wherein Ar, R¹ and J are as defined above; or a
pharmaceutically acceptable derivative or metabolite
thereof. Preferably, the invention provides a compound of
25 formula (4) in which Ar, R¹ and J are defined in accordance
with Table 1.

Table 1

30				

According to a further preferred embodiment, the present invention provides a compound of formula (5)

wherein Ar, Y, X¹, X², X³, X⁴, Z, J, R⁹, R¹⁰, R¹¹, R¹², Q and B as defined above.

More preferably, the invention provides a compound, according to formula (5), of the formula (6):-

wherein Ar, R¹, J, R⁹, R¹⁰, R¹¹, R¹² and B are as defined above.

According to a further preferred embodiment, the present invention provides a compound of formula (7):-

wherein Ar, Y, X¹, X³, X⁴, Z, J, Q and B are as defined above and T¹ and T² are independently selected from H and CH₂R⁸ wherein R⁸ is as defined above. Preferably, B is a purine base. More preferably, B is adenine. Preferably, T¹ is hydrogen. Preferably, T² is CH₂R⁸. These compounds are analogues of the acyclic nucleoside analogue 9-(2-phosphonylmethoxyethyl) adenine (PMEA), which has been demonstrated to show activity against herpes viruses and retroviruses (Calio *et al.*, Antiviral Res., (1994), 23(1), 77-89; Balzarini *et al.*, AIDS, (1991), 5(1), 21-28).

More preferably, the invention provides a compound, according to formula (7), of formula (8):-

wherein Ar, R¹, J, T¹, T² and B are as defined above.

It is a feature of the aryl ester phosphate compounds (1) of the present invention that they exhibit significantly enhanced anti-viral efficacy, in both *in vitro* and *in vivo* tests, in comparison to their corresponding nucleoside analogue (9)

In addition, the compounds of the present invention exhibit significantly reduced toxicity in comparison to their corresponding analogue (9).

The compounds of the present invention thus exhibit a greatly enhanced selectivity index (ratio of CC_{50} (toxicity): EC_{50} (activity)) in comparison to their corresponding nucleoside analogue.

Experiments with radiolabelled compounds of the present invention have shown that the compounds give enhanced intracellular levels of nucleoside 5'-triphosphate, the enhancement being particularly significant in TK⁺ cells. Thus, the compounds of the present invention may act in part by the known metabolic pathway.

However, it has been found that the compounds of the present invention show surprising activity against nucleoside resistant strains of HIV. This indicates that the compounds of the present invention are also acting by a pathway independent of a 5'-triphosphate metabolite.

It has been demonstrated that the compounds of the present invention lead to intracellular generation of high levels of a metabolite (10).

Metabolite (10) may also be prepared by treatment of the corresponding compound according to formula (1) with hog

liver esterase. Moreover, it has been shown that compounds of formula (10) are direct inhibitors of reverse transcriptase from HIV.

- 5 According to a further aspect of the present invention there is provided a compound of formula (10)

wherein Ar, Y, X¹, X², X³, X⁴, X⁶, T¹, T², Q, X⁵ and B are as defined above, or a pharmaceutically acceptable derivative or metabolite thereof.

- 20
- The intracellular generation of anti-viral metabolites such as (10) is an important feature of the invention for several reasons. Firstly, the direct activity of (10) on RT removes the necessity for further nucleotide-kinase mediated phosphorylation, which may be slow in many cases. In cases where the nucleoside monophosphate is not a substrate for host nucleotide kinases, activation will be poor and anti-viral efficacy low, even if the triphosphate is an excellent RT inhibitor. In such cases, the generation of metabolites such as (10) may lead to a very significant enhancement in antiviral action. Such compounds may be acting directly in their own right or via a rearrangement, decomposition or disproportionation product or via a contaminant. Moreover, the structure of metabolites such as (10) may be further designed to optimise binding to the known structure of RT, and such modified metabolites could be delivered intracellularly using technology herein described, to further enhance the anti-viral effect.
- 25
- 30
- 35

By "a pharmaceutically acceptable derivative" is meant any pharmaceutically acceptable salt, ester or salt of such ester or any other compound which upon administration to a recipient is capable of providing (directly or indirectly) a compound of formula (1) or (10). By "pharmaceutically acceptable metabolite" is meant a metabolite or residue of a compound of formula (1) or (10) which gives rise to a nucleoside-resistance independent or nucleoside 5'-triphosphate independent mode of reverse transcriptase inhibition exhibited by the compounds of formula (1) or (10).

According to a further aspect of the present invention there is provided a compound according to the present invention for use in a method of treatment, preferably in the prophylaxis or treatment of viral infection.

According to a further aspect of the present invention there is provided use of a compound according to the present invention in the manufacture of a medicament for the prophylaxis or treatment of viral infection.

According to a further aspect of the present invention there is provided a method of prophylaxis or treatment of viral infection comprising administration to a patient in need of such treatment an effective dose of a compound according to the present invention.

The viral infection may comprise any viral infection such as HIV and herpes virus, including HSV 1 and HSV 2, CMV, VZV, EBV, HAV, HBV, HCV, HDV, papilloma, rabies and influenza.

Preferably, the viral infection comprises HIV infection, more preferably HIV-I or HIV-II. It is a feature of the present invention that the compounds exhibit good activity against both HIV-I and HIV-II.

According to a further aspect of the present invention there is provided use of a compound of the present invention in

the manufacture of a medicament for use in the inhibition of a reverse transcriptase by a nucleoside-resistance independent or nucleoside 5'-triphosphate independent mode of action.

5

According to a further aspect of the present invention there is provided a pharmaceutical composition comprising a compound of the present invention in combination with a pharmaceutically acceptable excipient.

10

According to a further aspect of the present invention there is provided a method of preparing a pharmaceutical composition comprising the step of continuing a compound of the present invention with a pharmaceutically acceptable
15 excipient.

The medicaments employed in the present invention can be administered by oral or parenteral routes, including intravenous, intramuscular, intraperitoneal, subcutaneous,
20 transdermal, airway (aerosol), rectal, vaginal and topical (including buccal and sublingual) administration.

For oral administration, the compounds of the invention will generally be provided in the form of tablets or capsules, as
25 a powder or granules, or as an aqueous solution or suspension.

Tablets for oral use may include the active ingredient mixed with pharmaceutically acceptable excipients such as inert
30 diluents, disintegrating agents, binding agents, lubricating agents, sweetening agents, flavouring agents, colouring agents and preservatives. Suitable inert diluents include sodium and calcium carbonate, sodium and calcium phosphate, and lactose, while corn starch and alginic acid are suitable
35 disintegrating agents. Binding agents may include starch and gelatin, while the lubricating agent, if present, will generally be magnesium stearate, stearic acid or talc. If desired, the tablets may be coated with a material such as glyceryl monostearate or glyceryl distearate, to delay

absorption in the gastrointestinal tract.

Capsules for oral use include hard gelatin capsules in which the active ingredient is mixed with a solid diluent, and
5 soft gelatin capsules wherein the active ingredient is mixed with water or an oil such as peanut oil, liquid paraffin or olive oil.

Formulations for rectal administration may be presented as
10 a suppository with a suitable base comprising for example cocoa butter or a salicylate.

Formulations suitable for vaginal administration may be presented as pessaries, tampons, creams, gels, pastes, foams
15 or spray formulations containing in addition to the active ingredient such carriers as are known in the art to be appropriate.

For intramuscular, intraperitoneal, subcutaneous and
20 intravenous use, the compounds of the invention will generally be provided in sterile aqueous solutions or suspensions, buffered to an appropriate pH and isotonicity. Suitable aqueous vehicles include Ringer's solution and isotonic sodium chloride. Aqueous suspensions according to
25 the invention may include suspending agents such as cellulose derivatives, sodium alginate, polyvinylpyrrolidone and gum tragacanth, and a wetting agent such as lecithin. Suitable preservatives for aqueous suspensions include ethyl and n-propyl p-hydroxybenzoate.

30

The compounds of the invention may also be presented as liposome formulations.

In general a suitable dose will be in the range of 0.1 to
35 300 mg per kilogram body weight of the recipient per day, preferably in the range of 6 to 150 mg per kilogram body weight per day and most preferably in the range 15 to 100 mg per kilogram body weight per day. The desired dose is preferably presented as two, three, four, five or six or

more sub-doses administered at appropriate intervals throughout the day. These sub-doses may be administered in unit dosage forms, for example, containing 10 to 1500 mg, preferably 20 to 1000 mg, and most preferably 50 to 700 mg of active ingredient per unit dosage form.

According to a further aspect of the present invention there is provided a process for the preparation of a compound according to the present invention, the process comprising reaction of a compound of formula (11)

with a compound of formula (12)

The reaction may be carried out in the tetrahydrofuran in the presence of N-methylimidazole.

Alternatively, the compounds of the present invention may be prepared by reaction of a compound of formula (13) or a suitable derivative thereof

with ArOH and a compound of formula (14) or suitable
5 derivatives thereof

15 The invention will now be described with reference to the following Figures and Examples. It will be appreciated that what follows is by way of example only and that modifications to detail may be made whilst still falling within the scope of the invention.

20

Figure 1 illustrates the in vivo antiviral activity of d4T (comparative) and aryl ester phosphoramidate compound 324 in MSV infected mice. Drug doses are 50[low] or 200[high] mg/kg/day given i.p. for 4 days starting 1 hour before MSV
25 inoculation.

EXPERIMENTAL

30

All experiments involving water sensitive compounds were conducted under scrupulously dry conditions. Tetrahydrofuran was dried by heating under reflux over sodium and benzophenone followed by distillation and storage over
35 active sieves. N-methylimidazole was purified by distillation. Nucleosides were dried at elevated temperature in vacuo over P₂O₅. Proton, carbon and phosphorus Nuclear Magnetic Resonance (¹H, ¹³C, ³¹P nmr) spectra were recorded on a Bruker Avance DPX spectrometer

operating at 300 MHz, 75.5 MHz, and 121.5 MHz respectively. All nmr spectra were recorded in CDCl₃ at room temperature (20°C +/-3°C). ¹H and ¹³C chemical shifts are quoted in parts per million downfield from tetramethyisilane. J values refer to coupling constants and signal splitting patterns are described as singlet (s), broad singlet (bs), doublet (d), triplet (t), quartet (q), multiplet (m) or combinations thereof. ³¹P chemical shifts are quoted in parts per million relative to an external phosphoric acid standard. Many NMR peaks were further split due to the presence of diastereoisomers at the [chiral] phosphate centre. Chromatography refers to flash column chromatography and was carried out using Merck silica gel 60H (40-60 m, 230-400 mesh) as stationary phase. Thin layer chromatography was performed using Alugram SIL G/UV₂₅₄ aluminium backed silica gel plates.

Mass spectra were recorded by the fast atom bombardment (FAB) mode on a VG 70--250 spectrometer. HPLC data was recorded using an ACS quaternary system with an ODS5 column and an eluent of water/acetonitrile, with 82% water 0-10 min, and then a linear gradient to 20% water at 30 min, with a flow rate of 2mL/min and detection by UV at 265 nm.

The test compounds were isolated as mixtures of diastereoisomers, with this isomerism arising from mixed stereochemistry at the phosphate centre. The resulting oils did not give useful microanalytical data but were found to be pure by high-field multinuclear NMR spectroscopy and rigorous HPLC analysis.

Preparation of Compounds

The compounds of the present invention were prepared according to the following general procedures.

Preparation of aryl phosphorodichloridates (general procedure)

A solution of the appropriate phenol (30.4 mmol) and

triethylamine (4.25ml, 30.5 mmol) in dry CH_2Cl_2 (25ml) was added to a solution of freshly distilled POCl_3 (10ml, 107mmol) in CH_2Cl_2 (30ml) at -50° and the mixture allowed to stir at ambient temperature overnight. The reaction mixture was filtered and the filtrate evaporated. Ether (20ml) was added and precipitate filtered again. After evaporation the residue was distilled if possible.

Phenyl N-methylalaninyl phosphorochloridate

10 A solution of triethylamine (1ml-7.17mmol) in 15ml of dry CH_2Cl_2 was added dropwise to a mixture of phenyl phosphorodichloridate (757.4mg, 3.59mmol) and L-alanine methyl ester hydrochloride (500mg, 3.58mmol) in 50ml of dry CH_2Cl_2 at -80°C in one hour. The mixture was then stirred
15 vigorously at -50°C during five hours and CH_2Cl_2 evaporated. 25 ml of dry ether was added and precipitate filtered off under nitrogen. Evaporation of ether gave a colourless oil which was used without further purification for the next step.

20

Preparation of aryl phosphates of nucleoside analogues (general procedure)

Phenyl N-methylalaninyl phosphorochloridate (250 mg, 0.9 mmol, 2.0equivs) was added to a stirred solution of
25 nucleoside analogue 0.45mmol) and N-methyl imidazole (0.37ml, 143.5 μl , 1.8 mmol, 4equivs) in THF (2ml). After 4 hours, the solvent was removed under reduced pressure. The gum was dissolved in chloroform (10ml), and washed with 1M HCl (8ml), sodium bicarbonate (10ml) and water (15ml). The
30 organic phase was dried, and the solvent removed in vacuo. The residue was purified by column chromatography on silica with elution by chloroform-methanol (97:3). Pooling and evaporation of the eluent gave the product as a white solid.

In vitro Testing

Cells were infected with HIV-1 as previously described
5 [Balzarini et al. AIDS (1991), 5, 21-28]. Briefly, 5 x
10⁵ cells per milliliter were infected with HIV-1 or HIV-2
at 100 CCID₅₀ (50% cell culture infective dose) per
milliliter of cell suspension. Then 100 µL of the infected
10 cell suspension was transferred to microtiter plate wells
and mixed with 100 µL of the appropriate dilutions of the
test compounds. After 4 days giant cell formation was
recorded microscopically in the HIV-infected cell cultures
[CEM], and after 5 days the number of viable cells was
15 determined by trypan blue staining of the HIV-infected cell
cultures [MT4]. The 50% effective concentration (EC₅₀) and
50% cytotoxic concentration (CC₅₀) were defined as the compound
concentrations required to reduce by 50% the number of giant
cells or viable cells in the virus-infected and mock-
infected cell cultures, respectively.

20

The anti-HIV-1 activities and toxicities of compounds were
also assessed in two cell lines:

C8166 cells. Cells were grown in RPMI 1640 with 10% calf
25 serum. 4 x 10⁴ cells per microtiter plate well were mixed
with 5-fold dilutions of compound prior to addition of 10
CCID₅₀ units of III-B strain of HIV-1 and incubated for 5-7
days (Betbeder et al. Antiviral Chem. Chemother. 1, 241-247,
1990). Formation of syncytia was examined from 2 days post-
30 infection. Culture fluid was collected at 5-7 days and
gp120 antigen production measured by ELISA (Mahmood and Hay,
J. Immunol. Meth., 151, 9-13, 1992). The EC₅₀ is that
concentration of drug [in µM] required to reduce gp120
production by 50%. Cell viability of infected and
35 uninfected cells were assessed by the MTT-Formazen method
(Pauwels et al. J. Virol. Meth. 20, 309-321, 1988).

JM cells JM cells, which are relatively resistant to the
antiviral effects of AZT and a number of its derivatives,

were infected with HIV-1 strains and the antiviral and toxic effects of compounds assessed as for C8166 cells. Both GB8 or IIIB strains of HIV1 were used, with no detectable differences in the end-points noted.

5

Each assay was carried out in duplicate, on at least two separate occasions, and data quoted are the average of each separate assay.

- 10 The compounds of the present invention have been shown to be active against both HIV1 and HIV2 in both TK⁺ and TK⁻ cells as illustrated in Table 2.

Table 2

15

Compound	HIV1 in C8166/JM		HIV2 in CEM TK ⁺ /CEM TK ⁻	
	EC ₅₀	μ M	EC ₅₀	μ M
	C8166	JM	CEM TK ⁺	CEM TK ⁻
730	0.0008	0.0008	0.016	0.06
d4T (comparative)	0.08	0.8	1.2	>100

20

As expected, d4T (comparative) loses activity in the kinase deficient cells (especially CEM TK⁻), whilst compound 730 of the invention retains good activity in both TK⁺ and TK⁻ against both HIV1 and HIV2. Compound 730 of the invention is >1000 times more potent than d4T in TK⁻ cells. Surprisingly, the compound is 100-fold more potent than d4T in CEM TK⁺ assays.

25

- 30 The potent activity of the compounds of the invention is further supported by the data in Table 3, which illustrates activity, toxicity and selectivity index of a series of compounds of the present invention.

- 35 The enhanced anti-viral potency and reduced cytotoxicity of the phosphate derivatives lead to very large improvements in

The enhanced anti-viral potency and reduced cytotoxicity of the phosphate derivatives lead to very large improvements in selectivity index [defined as CC_{50}/EC_{50}] evidencing marked improvements in in vivo efficacy compared to d4T
5 (comparative).

Evidence that the compounds of the present invention are acting via a pathway different to that of d4T or AZT is provided by the data of Table 4.

10

As can be seen, whilst the potency of d4T (comparative) is much reduced in nucleoside resistant strains, the potency of the compounds of the present invention is largely maintained. Thus, it is clear that the compounds of the
15 present invention are not acting primarily via the conventional nucleoside 5'triphosphate derivative.

CEM and MT4 cells (at 400,000 cells/ml) and PBL cells (at 2,000,000 cells/ml) were exposed to different concentrations
20 of [3H] 324 and incubated at 37°C for 24 hours. Then cells were washed twice with cold PBS and to the cell pellet was added 400 μ l cold methanol 66%. After standing on ice for 10 min, the cell extract was centrifuged and the supernatant analyzed on HPLC. As shown in Table 5, intracellular D4T-
25 MP (monophosphate) levels increased proportionally in function of the initial concentration of 324 in all three cell lines tested. However, the increase of D4T-TP (triphosphate) levels slowed down at initial 324 concentrations that were higher than 25 μ M (for CEM and MT4
30 cells) or higher than 1.0 μ M (for PBL). Surprisingly, a metabolite (designated X) accumulated substantially and predominantly in all three cell types. The accumulation was proportional to the initial 324 concentration, and, again, was lower in PBL than CEM and MT4 cells.

35

When 1mM 324 was incubated with high concentrations of hog liver esterase at 37°C in Tris-HCl buffer containing 5 mM $MgCl_2$, a time-dependent formation of a metabolite was observed. This metabolites co-eluted with the predominant

metabolite (X) that was found in the cell extracts after incubation of the intact cells with [³H] 324. metabolite X corresponds to a compound of formula (10), wherein Y is oxygen, X¹ is NH, X² is oxygen, B is thymine, R¹ is Me, R² is hydrogen.

Data on an expanded range of compounds is presented in Table 6 (d4T analogues) and Table 7 (dideoxy and 3' - β - substituted nucleoside analogues) in which:-

Cpd and Init : refer to the compound reference numbers;
Y : refers to the group:-

Z : refers to the 3' - substituent on a deoxyribose sugar wherein the substituent is in an "α" orientation (R⁹) unless designated "up" which refers to a "β" orientation (R¹⁰);

B : refers to the heterocyclic nucleic acid base, present at C1' in β - orientation; conventional one-letter base codes are used; pyrimidine substituents are at C5.

The data columns are, in order:

HIV1 MT4: EC₅₀ in μM for inhibition of HIV-1 in MT4 cells.

HIV2 MT4: EC₅₀ in μM for inhibition of HIV-2 in MT4 cells.

CC50 MT4: CC₅₀ in μM for toxicity to MT-4 cells.

HIV1 CEM: EC₅₀ in μM for inhibition of HIV-1 in CEM cells.

HIV2 CEM: EC₅₀ in μM for inhibition of HIV-2 in CEM cells.

HIV2 CEM-TK: EC₅₀ in μM for inhibition of HIV-2 in CEM/TK cells.

CC50 CEM: CC_{50} in μM for toxicity to CEM cells.

EC50 MSV: EC_{50} in μM for inhibition of MSV

MCC MSV: Minimum cytotoxic concentration in MSV assay

- 5 Where data of table 6 differs from that presented in Tables 2 to 5, the data of the former relates to the mean result obtained from two or more repeat experiments, whereas the latter relates to individual experimental results.

TABLE 7

In vivo Testing

Inhibitory effects of test compounds on the initiation of MSV-induced tumour formation in NMRI mice and on the survival of MSV innoculated NMRI mice.

Mice infected with Moloney Sarcoma Virus [MSV] were treated daily with either placebo, or d4T [at one of two doses] or with compound 324 at one of the same [equi-molar] doses.

Two- to three-day old NMRI mice (weighing ~ 2 gram) were innoculated subcutaneously (s.c.) in the left hind leg with 50 μ l MSV (100 foci forming units, as measured by in vitro determination of the virus-induced transformation of murine C3H embryo fibroblast cells). At 4 to 5 days post-infection, tumours develop and rapidly increase in volume upon further aging of the mice. Within 10 to 12 days post-infection, mice (then weighing ~ 5 to 6 gram) die from the viral infection. Drug treatment started 1 hour prior to infection of the virus, and further compound administration was given daily i.p. for an additional 3 days. The mean day of tumour initiation (\pm standard deviation) and the mean day of survival of the mice (\pm standard deviation) was calculated and statistical significance of the average delay of tumour formation and the mean day of survival in the treated groups versus the untreated (control) group was assessed by two-tailed student's t-test.

Whilst d4T failed to give any detectable delay in either tumour appearance or death, a significant effect on both parameters was seen with high-dose compound 324, and an effect on the first disease parameter at low dose [Figure 1].

CLAIMS:

1. A compound of the formula (1)

5

10

15 wherein Ar is an aryl group;

Y is oxygen or sulphur;

20 X¹ is selected from O, NR³, S, CR³R⁴, CR³W¹ and CW¹W² where R³ and R⁴ are independently selected from hydrogen, alkyl and aryl groups; and W¹ and W² are heteroatoms;

25 X²-X⁶ may be absent; or X⁶ is CH₂ and X² is selected (independently of X¹) from O, NR³, S, CR³R⁴, CR³W¹ and CW¹W² where R³ and R⁴ are independently selected from hydrogen, alkyl and aryl groups; and W¹ and W² are heteroatoms;

30 X³ is a C₁₋₆ alkyl group;

X⁴ is oxygen or CH₂;

X⁵ may be absent or is CH₂;

35

Z is selected from O, NR⁵, S, alkyl and aryl groups, where R⁵ is selected from hydrogen, alkyl and aryl groups;

J is selected from hydrogen, alkyl, aryl, heterocyclic and polycyclic groups;

5 Q is selected from O, NR⁶, S, CR⁶R⁷, CR⁶W³ and CW³W⁴ where R⁶ and R⁷ are independently selected from hydrogen, alkyl and aryl groups; and W³ and W⁴ are heteroatoms;

10 T¹ and T² are independently selected from hydrogen and CH₂R⁸, where R⁸ is selected from H, OH and F; or T¹ and T² are linked together and together are selected from the groups

20 where R⁹ is selected from H, halogen, CN, NH₂, CO-alkyl and alkyl; and R¹⁰, R¹¹ and R¹² are independently selected from H, N₃, halogen, CN, NH₂, CO-alkyl and alkyl;

B is a purine or pyrimidine base;

25 or a pharmaceutically acceptable derivative or metabolite thereof.

2. A compound according to claim 1 wherein

30 Y is oxygen;
X¹ is NH;
X³ is CHR¹;
X⁴ is oxygen; and
Z is oxygen.

35

3. A compound of formula (10)

10 or pharmaceutically acceptable derivative or metabolite thereof.

4. A compound according to claim 3 wherein

15 Y is oxygen;
 X¹ is NH;
 X³ is CHR¹; and
 X⁴ is oxygen

20 5. A compound according to any one of claims 1 to 4 wherein

X² is oxygen;
 X⁶ is CH₃;
 25 Q is oxygen;
 X⁵ is absent; and
 T¹ and T² together comprise the group:-

30

35 6. A compound according to claim 5 wherein B is thymine.

7. A compound according to claim 6 wherein Ar, R¹ and J are defined as follows:-

Compound Reference	Ar	R ¹	J
323	4-EtPh	Me	Me
324	Ph	Me	Me
5 327	4-FPh	Me	Me
526	3-CF ₃ Ph	Me	Me
546	3,5-Cl ₂ Ph	Me	Me
730	Ph	Me	Bzl
776	2,4-Br ₂ Ph	Me	Me
10 779	F ₃ Ph	Me	Me
862	Ph	Me	Hexyl
863	Ph	Bzl	Me
864	Ph	CH ₂ iPr	Me
865	Ph	iPr	Me
15 866	Ph	H	Me
867	Ph	[CH ₂] ₂ SMe	Me
868	2,4Br ₂ Ph	Me	Bzl
877	Ph	Bzl	Bzl
878	Ph	Bzl	tBu
20 892	Ph	Me	Cyclohexyl
893	Ph	Me	tBu
1078	Ph	CH ₂ CO ₂ H	Me
1214	Ph	CH ₂ CH ₂ CH ₂ NHC(NH ₂)NH	Me
1218	Ph	Me	n-Pent
25 1219	Ph	Me	neo-Pent
1225	Ph	Me	1-Napthyl
1227	Ph	Me	2-Napthyl

30 8. A compound according to any one of claims 1 to 4 wherein

X² is oxygen;

X⁶ is CH₂;

Q is oxygen;

35 X⁵ is absent; and

T¹ and T² together comprise the group:-

40

9. A compound according to claim 8 wherein B is adenine or thymine.
10. A compound according to any one of claims 1 to 4 wherein
5 X^2-X^6 is absent
Q is oxygen;
 X^5 is CH_2 ;
 T^1 and T^2 are independently selected from hydrogen and CH_2R^8 wherein R^8 is selected from H, OH and F.
- 10
11. A compound according to claim 9 wherein B is adenine.
12. A compound according to any one of claims 1 to 11 for use in a method of treatment, prophylaxis or diagnosis.
- 15
13. Use of a compound according to any one of claims 1 to 11 in the manufacture of a medicament for the treatment or prophylaxis of a viral infection.
- 20 14. Use of a compound according to claim 13 wherein the viral infection comprises HIV.
15. A process for the preparation of a compound according to any one of claims 1 to 11 comprising reaction of a compound
25 of formula (11)

30

35 with a compound of formula (12)

5

10 16. A method of prophylaxis or treatment of viral infection comprising administration to a patient in need of such treatment an effective dose of a compound according to any one of claims 1 to 11.

15 17. Use of a compound according to any one of claims 1 to 11 in the manufacture of a medicament for use in the inhibition of a reverse transcriptase by a nucleoside-resistance independent or nucleoside 5'-triphosphate independent mode of action.

20

18. A pharmaceutical composition comprising a compound according to any one of claims 1 to 11 in combination with a pharmaceutically acceptable excipient.

☒ Further documents are listed in the continuation of box C.

☐ Patent family members are listed in annex.

* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier document but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

"&" document member of the same patent family

INTERNATIONAL SEARCH REPORT

International application No.

PCT/GB96/00580

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
Remark : Although claim 16 is directed to the treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compounds (rule 39.1 (iv) PCT).
2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

☐ The additional search fees were accompanied by the applicant's protest.☐ No protest accompanied the payment of additional search fees.
